Category:Soundtrack databasesRespiratory Syncytial Virus infection causes severe bronchiolitis in preterm infants. Respiratory Syncytial Virus (RSV) is the most common cause of lower respiratory tract infections in young children and preterm infants and can be associated with significant morbidity and mortality. We performed a study in order to evaluate the clinical features and outcome of preterm infants with RSV bronchiolitis requiring admission to the neonatal intensive care unit, and to evaluate the prevalence of coinfection with B. pertussis, H. Influenzae, M. Pneumonia and influenza virus. A retrospective analysis of all preterm infants aged less than 365 days, admitted to the neonatal intensive care unit during a three-year period, because of RSV bronchiolitis, were selected. The prevalence of co-infections with B. pertussis, H. Influenzae, M. Pneumonia and influenza virus were also evaluated. The demographic and clinical characteristics of all infants were similar to those reported in the literature. The commonest associated clinical features were; apnea of prematurity, cardiorespiratory instability, bronchopulmonary dysplasia, hypocalcemia and feeding intolerance. Twenty-seven of the 30 preterm infants (90%) admitted for RSV bronchiolitis required mechanical ventilation, 19 (63%) infants developed B. pertussis as a concomitant infection. There was no significant increase in the prevalence of secondary infections. Although the most common associated clinical presentation was one of apnea, prematurity and intubation were not necessarily associated with the need for hospitalization. Preterm infants are at risk of severe RSV infection and B. pertussis is a major cause of severe RSV bronchiolitis.Q: Creating an object from a given object I'm going to start of by saying that this is probably a very simple solution to a question but I'm curious if there is a class/function out there that will allow a programmer to create an object given a base class and a list of class properties. I'm basically building a self type plugin system for a game. I'm trying to break up the list of objects into simple, self contained plugin classes which contain the object data that my game needs and then have a plugin manager that will load them. So say I have a list of classes like this: public class Entry 55cdc1ed1c
